

**AIHA CASE #18**

1. As a start to interpreting this case summarize the findings in the antibody detection tests (gel and saline tube methods) , and in each of the panels.
  
2. What antibody(ies) do you think are likely present? Is(are) this(these) allo- or auto-antibody? Is your interpretation proven?
  
3. Comment on the sensitivity and specificity of the different techniques used for the panels. Had the autocontrol been performed with the gel panels would it have changed your answer? What else might you have done to substantiate your interpretation?
  
4. How would you select compatible blood for this patient?
